

METHOD, SYSTEM, AND PROGRAM FOR TRANSFERRING  
DATA FROM AN APPLICATION ENGINE

ABSTRACT

Provided is a method, system, and program for enabling access to resource objects  
5 in an application engine. A request is received from a calling entity for resource objects  
of a specified type in the application engine. A request to the application engine is  
generated for information on available resource objects of the specified type. In response  
to receiving the information from the application engine, a collection object is generated  
including one metadata element for each resource object of the specified type in the  
10 application engine. The generated collection object is returned to the calling entity.
